

Wisconsin 2006 Residential FTTP in Place

-  Residential FTTP Reported in Place
-  Residential FTTP in Progress
-  No Residential FTTP Reported

This map indicates ILEC reported Fiber to the Premises (FTTP) locations where fiber terminates at residential customers' homes. Residential FTTP has been implemented or construction is underway in a number of communities across the state. This construction may include FTTP to a new subdivision or to an entire municipal area, as in the case of Monroe, WI. This advanced service provides for higher transmission speeds and higher quality voice, video and Internet transmission. In the last few years, more providers have been replacing their copper networks with fiber facilities, thus providing residential customers with fiber access where once only business customers had this access.
