

Wisconsin 2006 CATV Broadband Service Availability

Cable TV (CATV) Companies reported providing broadband-type Internet access to their customers via cable modems. These systems mainly use hybrid facilities made up of coaxial and fiber cable. Fiber is normally installed in the backbone network and coaxial is extended to the customer premises. The CATV companies serve mainly residential customers. The map reflects areas served by zip code. The CATV providers may serve all or part of the zip code indicated. All premises in a zip code are thus not assured of having access to a CATV offering. For example, a CATV provider may serve in a municipality but not in the rural areas of the same zip code.
